

# Schematizing Trust in Named Data Networking

Yingdi Yu<sup>1</sup>, Alex Afanasyev<sup>1</sup>, David Clark<sup>2</sup>,  
kc claffy<sup>3</sup>, Van Jacobson<sup>1</sup>, Lixia Zhang<sup>1</sup>

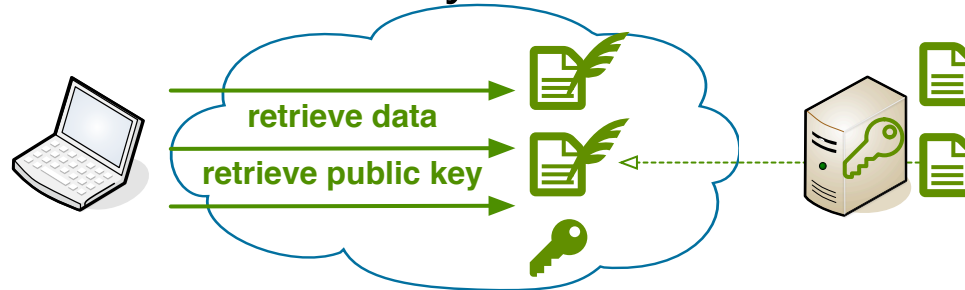

1. UCLA 2. MIT 3. CAIDA

# Motivation

- Usability is critical to security solutions
- Tool to explicitly express trust model
- Mechanism to automate trust management

# Data Authentication in NDN

- Data-centric authenticity

- mandate signature on every data packet
- Data authentication needs public key only

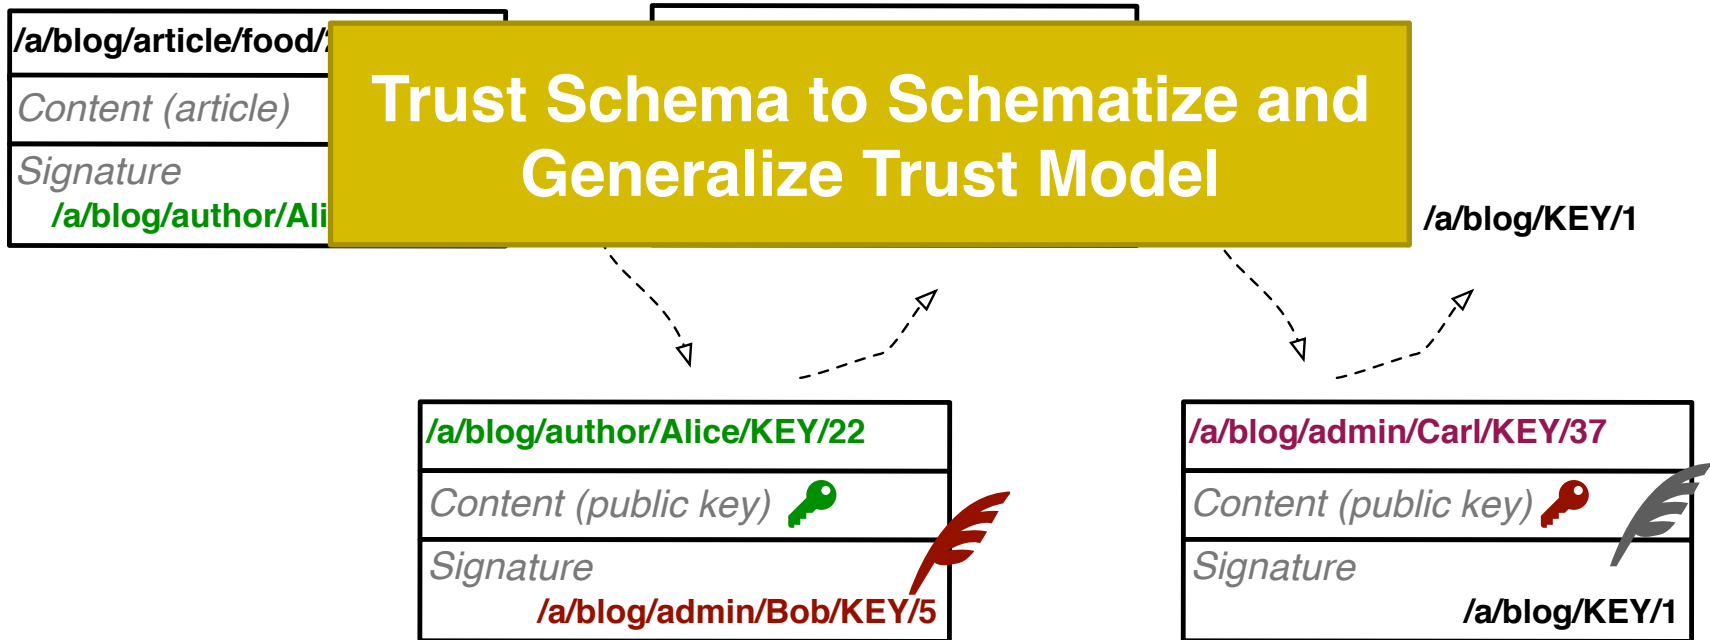

- independent from where/how data packet is retrieved
- privilege of online signing key can be restricted

# Trust Model

- Data signing and verification require a trust model
  - one or more pre-trusted keys
  - which key is authorized to sign/verify which data
    - key is just another type of data
  - defines strict authentication path for each data
- Trust model is application specific
  - keys may have different privileges
- Trust may go across different namespaces

# NDN Insight

- Trust model can be defined in a set of relationships between data names and key names

# Usable Security

- Need to be easily expressible
  - trust model is application specific
  - given a trust schema, anyone can authenticate data
    - consumers, dedicated storages, routers, ...
  - help producers to sign data
- Need to be automated
  - otherwise developers will “temporarily” disable security
    - fake signature, no authentication
- Better to be re-usable
  - applications may share the same trust model

# Trust Between Entities

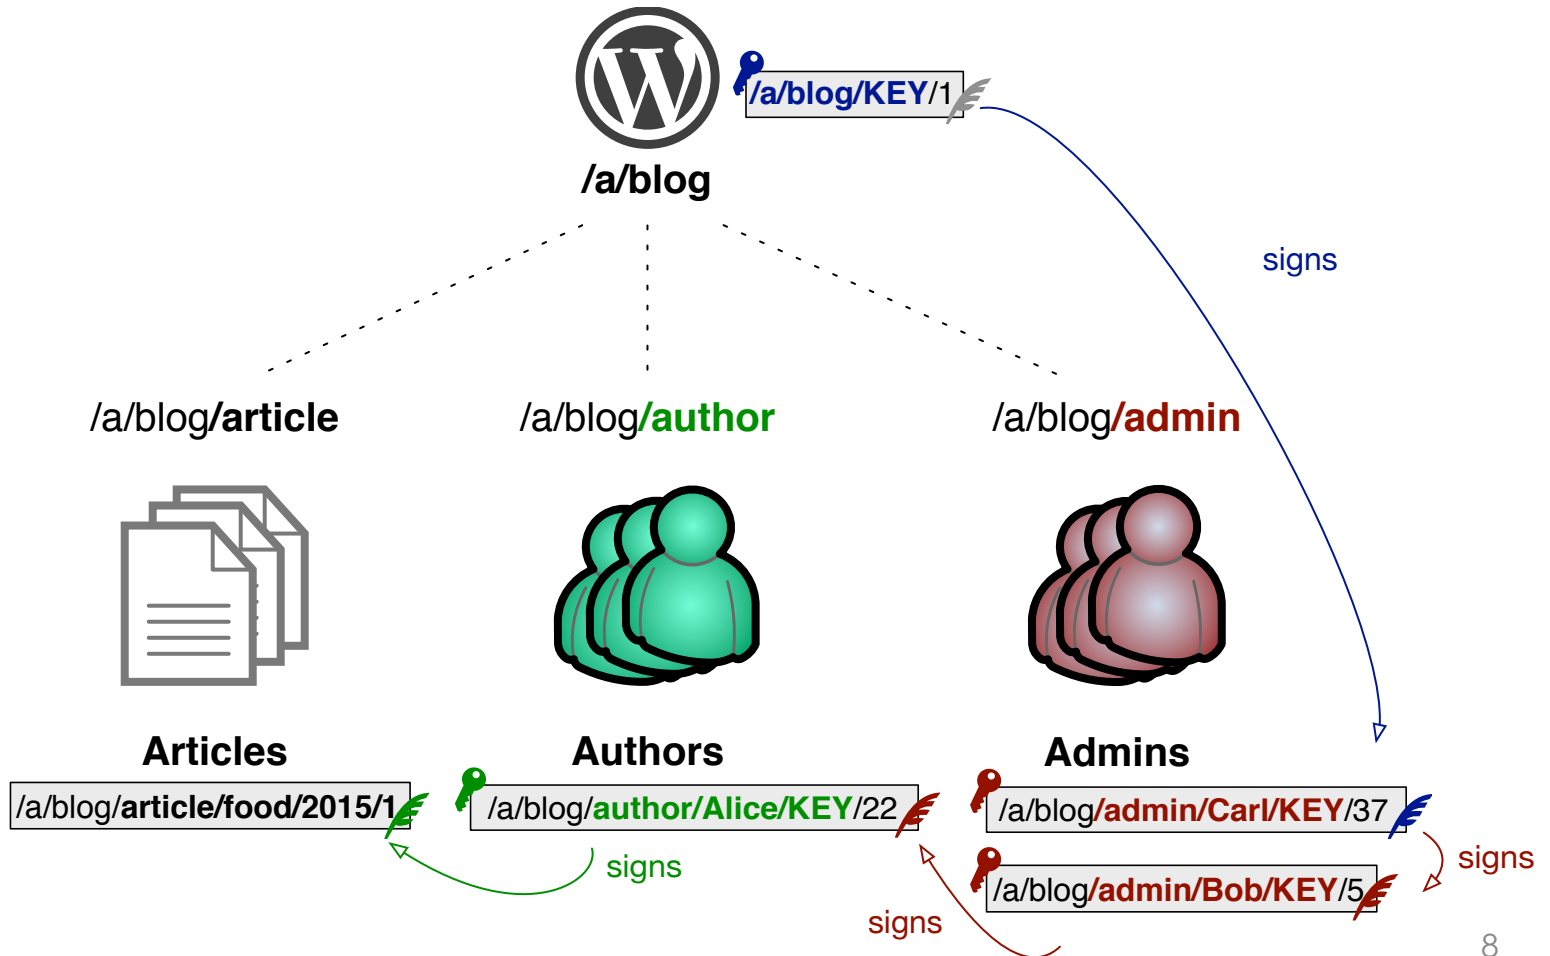

- Blog website framework
  - used by many people to set their own website

- authors can publish articles
- admins can create author account
- blog configuration and admins can designate other admins

# Name-based Trust

- Blog framework namespaces

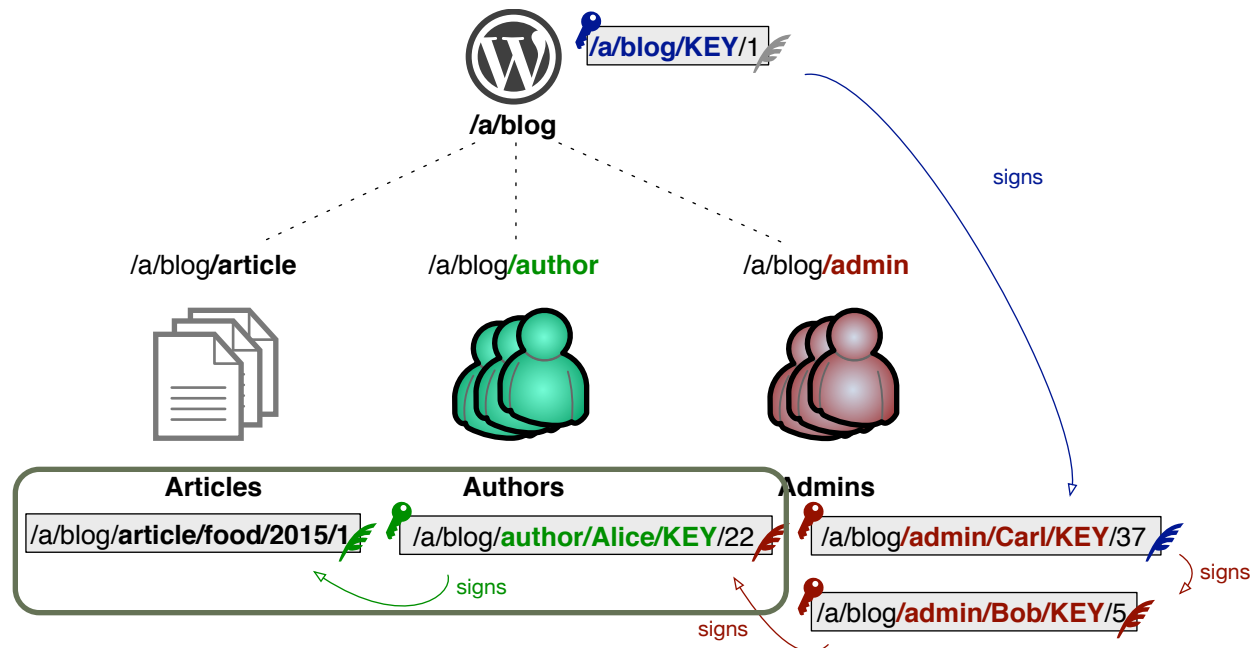

# Generalize Trust Relationship

- Relationship between data and key names

`/a/blog/article/food/2015/3` ← `/a/blog/author/Alice/KEY/22`

`/a/blog/article/drink/2014/9` ← `/a/blog/author/Zach/KEY/5`

# Generalize Trust Relationship

- Relationship between data and key names

`/a/blog/article/food/2015/3` ← `/a/blog/author/Alice/KEY/22`  
`/a/blog/article/drink/2014/9` ← `/a/blog/author/Zach/KEY/5`

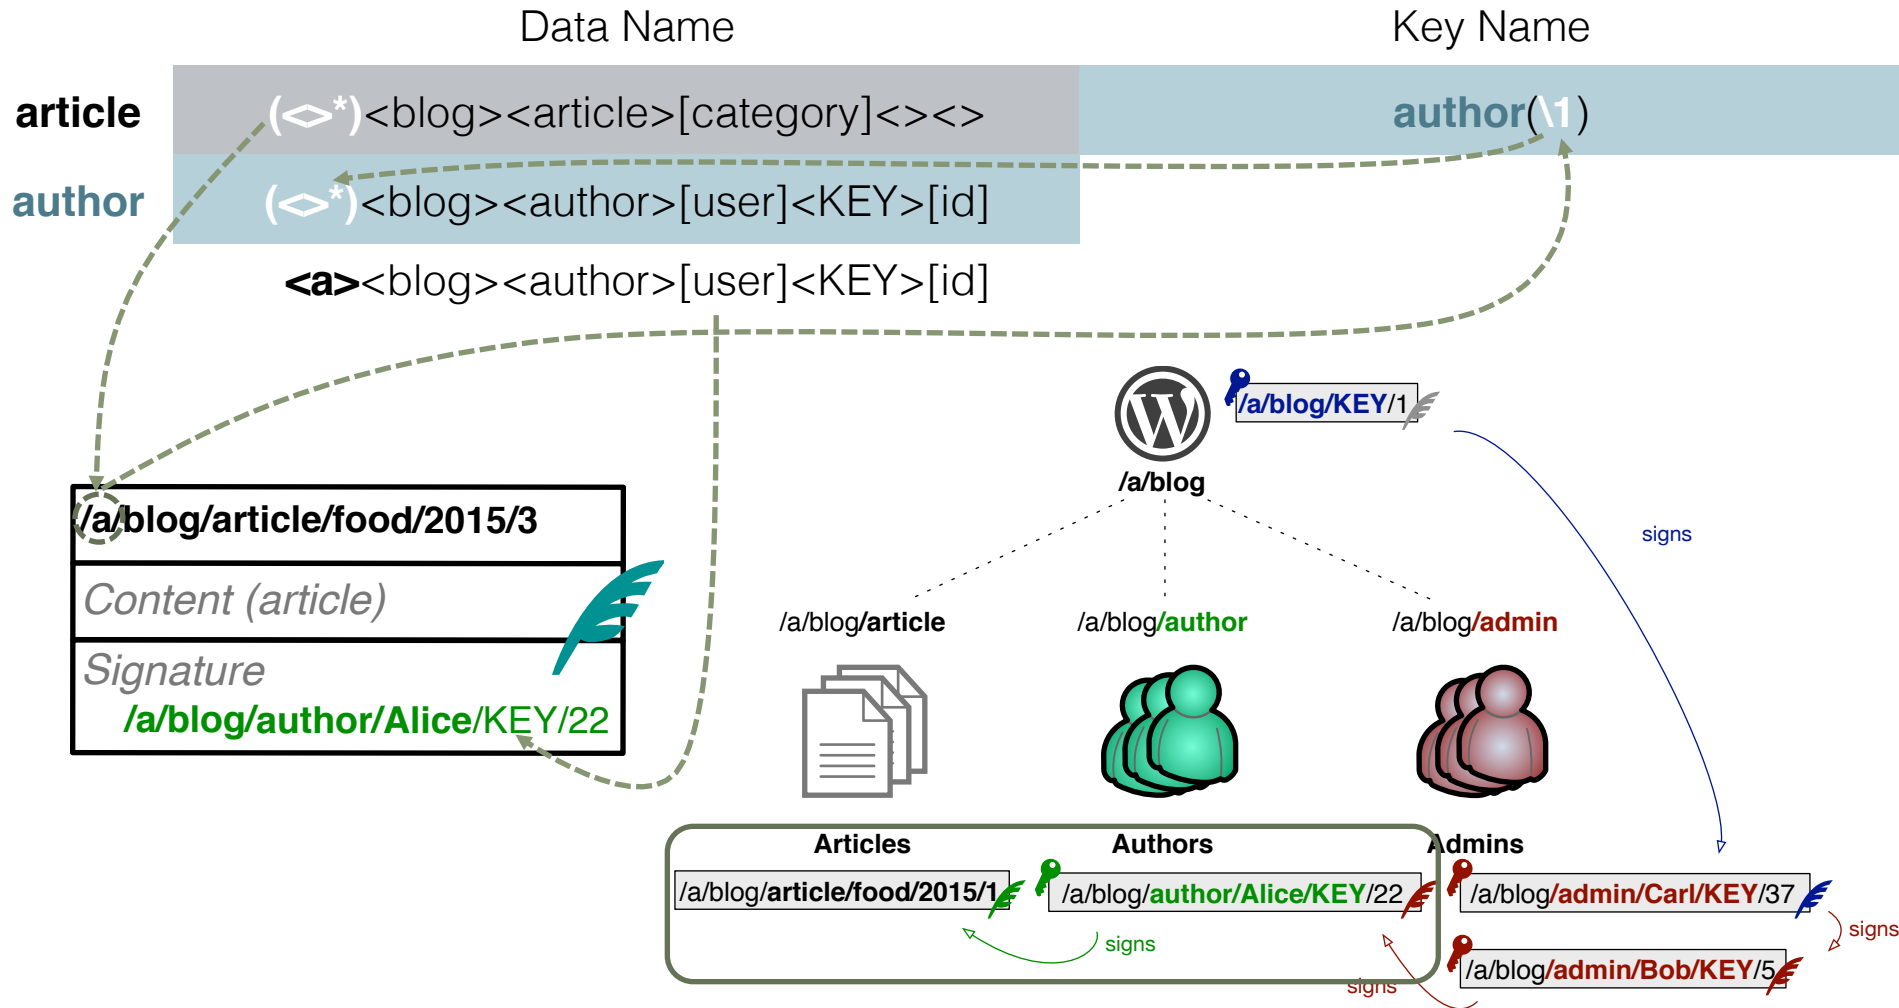

- Generalize relationship

`blog_prefix` + "blog" + "article" + `category` + `misc_info` ↗  
`blog_prefix` + "blog" + `author` + `name` + "KEY" + `key_id`

- Regex-based syntax

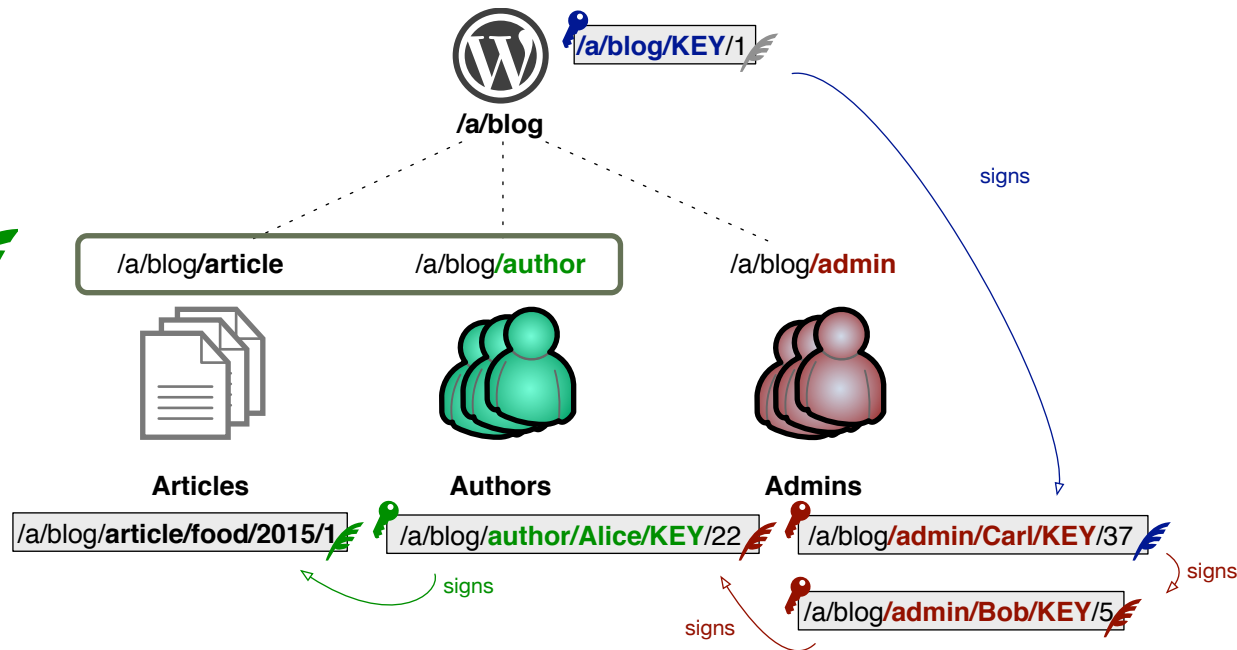

`(<*><blog><article>[category]<><>` ↗  
`\1<blog><author>[user]<KEY>[Id]`

# Key Name Pattern Derivation

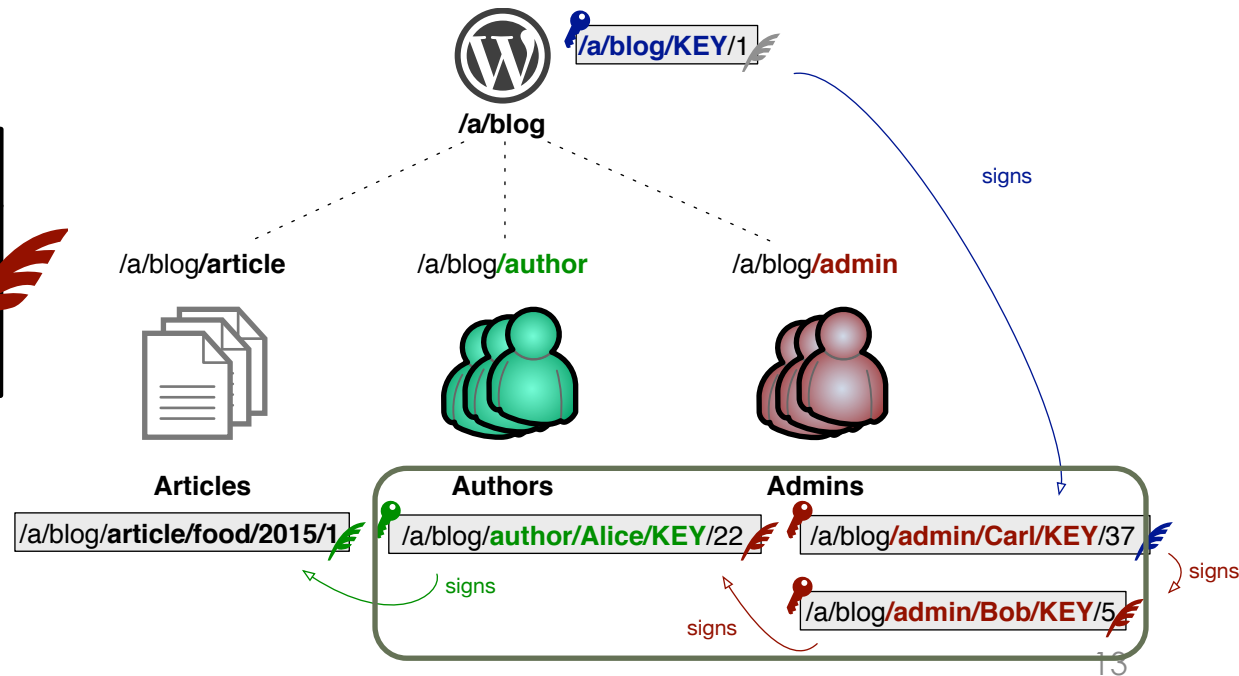

# Enforce Least Privilege

	Data Name	Key Name
<b>article</b>	<code>(&lt; &gt;*)&lt;blog&gt;&lt;article&gt;[category]&lt;&gt;&lt;&gt;</code>	<b>author(\1)</b>
<b>author</b>	<code>(&lt; &gt;*)&lt;blog&gt;&lt;author&gt;[user]&lt;KEY&gt;[id]</code>	

# Link Trust Relationship

	Data Name	Key Name
<b>article</b>	$(\langle \rangle^*) \langle \text{blog} \rangle \langle \text{article} \rangle [\text{category}] \langle \rangle \langle \rangle$	<b>author</b> (\1)
<b>author</b>	$(\langle \diamond \rangle^*) \langle \text{blog} \rangle \langle \text{author} \rangle [\text{user}] \langle \text{KEY} \rangle [\text{id}]$	<b>admin</b> (\1)
<b>admin</b>	$(\langle \diamond \rangle^*) \langle \text{blog} \rangle \langle \text{admin} \rangle [\text{user}] \langle \text{KEY} \rangle [\text{id}]$	

# Multiple Trusted Signers

	Data Name	Key Name
<b>article</b>	<code>(&lt;&gt;*)&lt;blog&gt;&lt;article&gt;[category]&lt;&gt;&lt;&gt;</code>	<b>author(\1)</b>
<b>author</b>	<code>(&lt;&gt;*)&lt;blog&gt;&lt;author&gt;[user]&lt;KEY&gt;[id]</code>	<b>admin(\1)</b>
<b>admin</b>	<code>(&lt;&gt;*)&lt;blog&gt;&lt;admin&gt;[user]&lt;KEY&gt;[id]</code>	<b>admin(\1)</b>

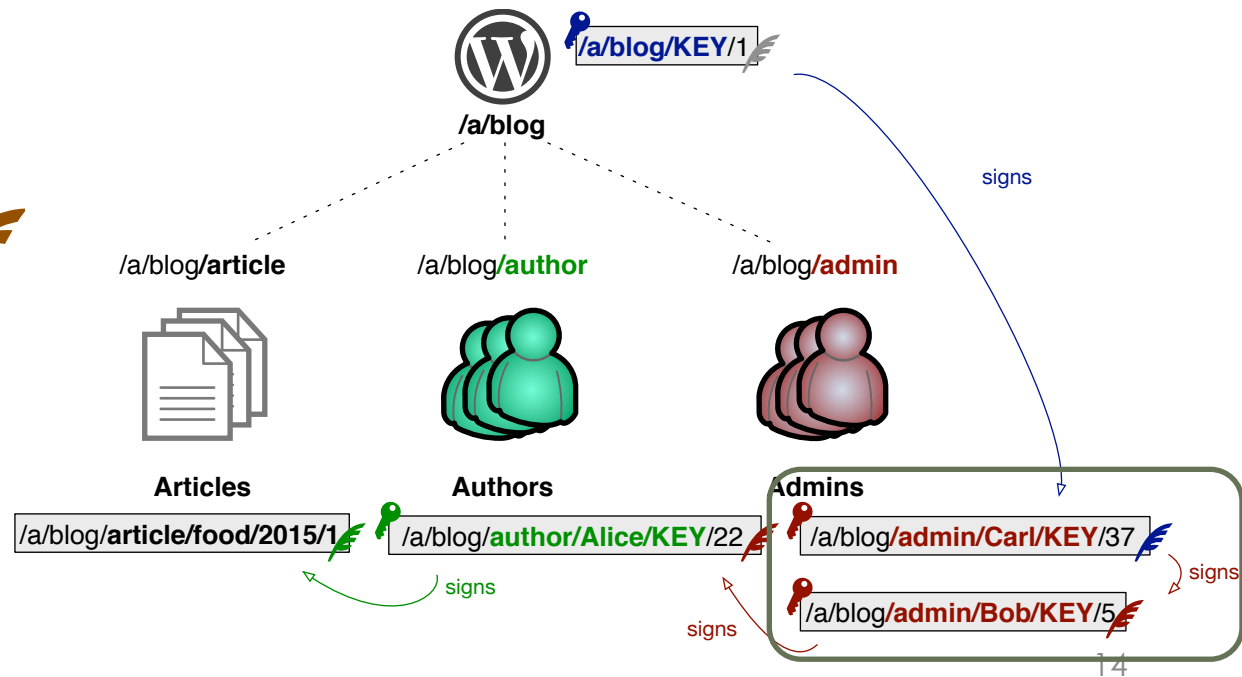

**/a/blog/admin/Bob/KEY/5**

---

*Content (public key)* 

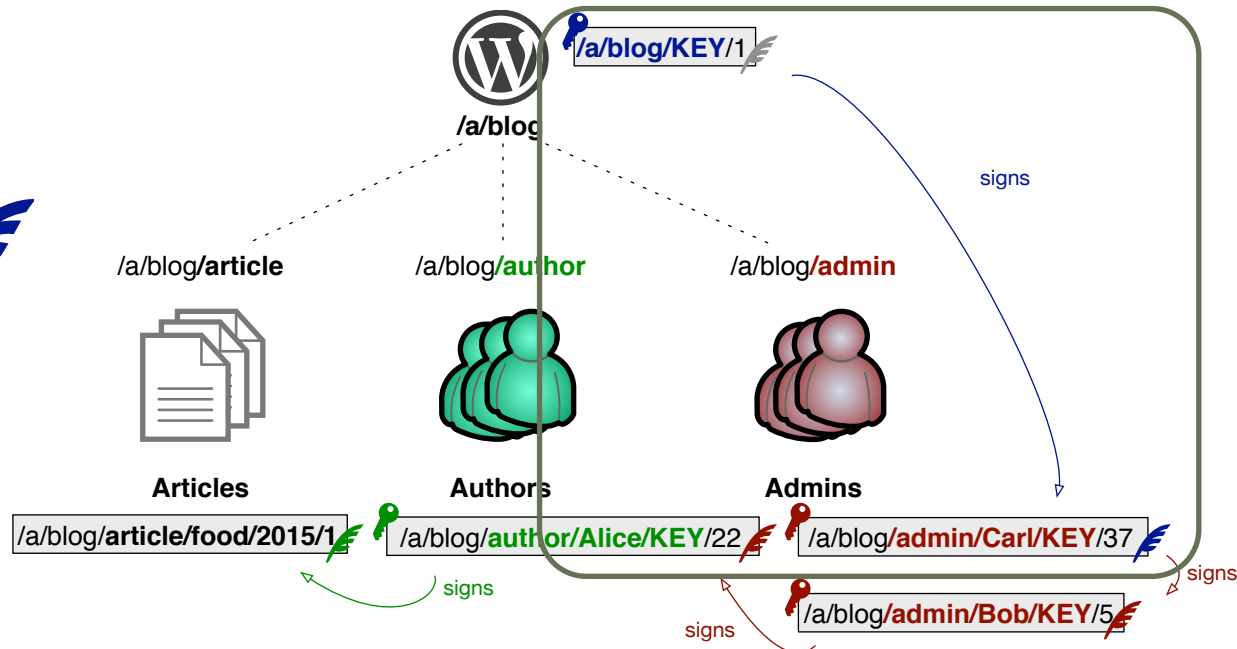

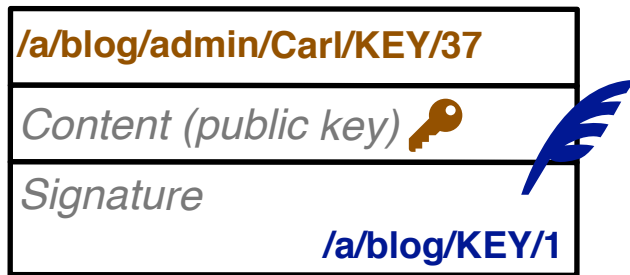

---

*Signature*  
**/a/blog/admin/Carl/KEY/37**

# Link Trust Anchor

	Data Name	Key Name
<b>article</b>	<code>(&lt;&gt;*)&lt;blog&gt;&lt;article&gt;[category]&lt;&gt;&lt;&gt;</code>	<b>author(\1)</b>
<b>author</b>	<code>(&lt;&gt;*)&lt;blog&gt;&lt;author&gt;[user]&lt;KEY&gt;[id]</code>	<b>admin(\1)</b>
<b>admin</b>	<code>(&lt;&gt;*)&lt;blog&gt;&lt;admin&gt;[user]&lt;KEY&gt;[id]</code>	<b>admin(\1)</b>

# Trust Schema

	Data Name	Key Name
<b>article</b>	(<>*)<blog><article>[category]<><>	<b>author</b> (\1)
<b>author</b>	(<>*)<blog><author>[user]<KEY>[id]	<b>admin</b> (\1)
<b>admin</b>	(<◇*)<blog><admin>[user]<KEY>[id]	<b>admin</b> (\1) <b>root</b> (\1)

	Key Name	Key
<b>root</b>	(<◇*)<blog><KEY>[id]	/a/blog/KEY/1 (0x30 0x82 ...)

Different trust anchor for different blog website

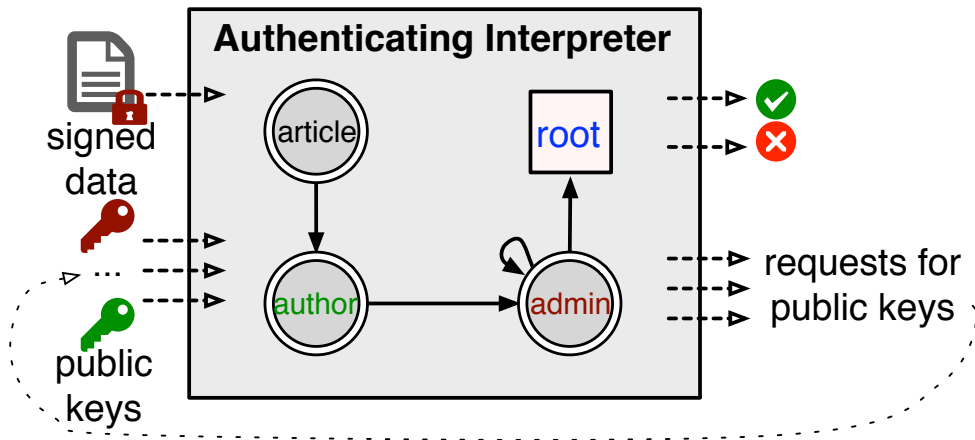

# Re-usability

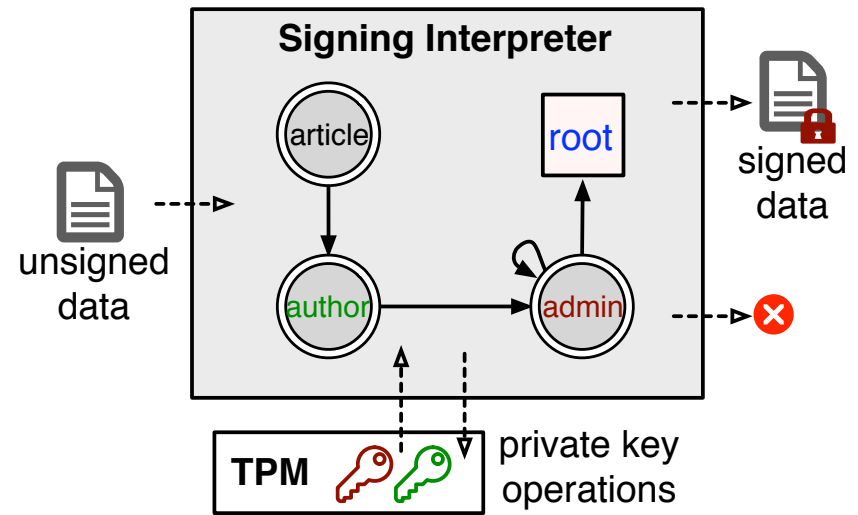

# Automation

- Trust schema  $\rightarrow$  FSM

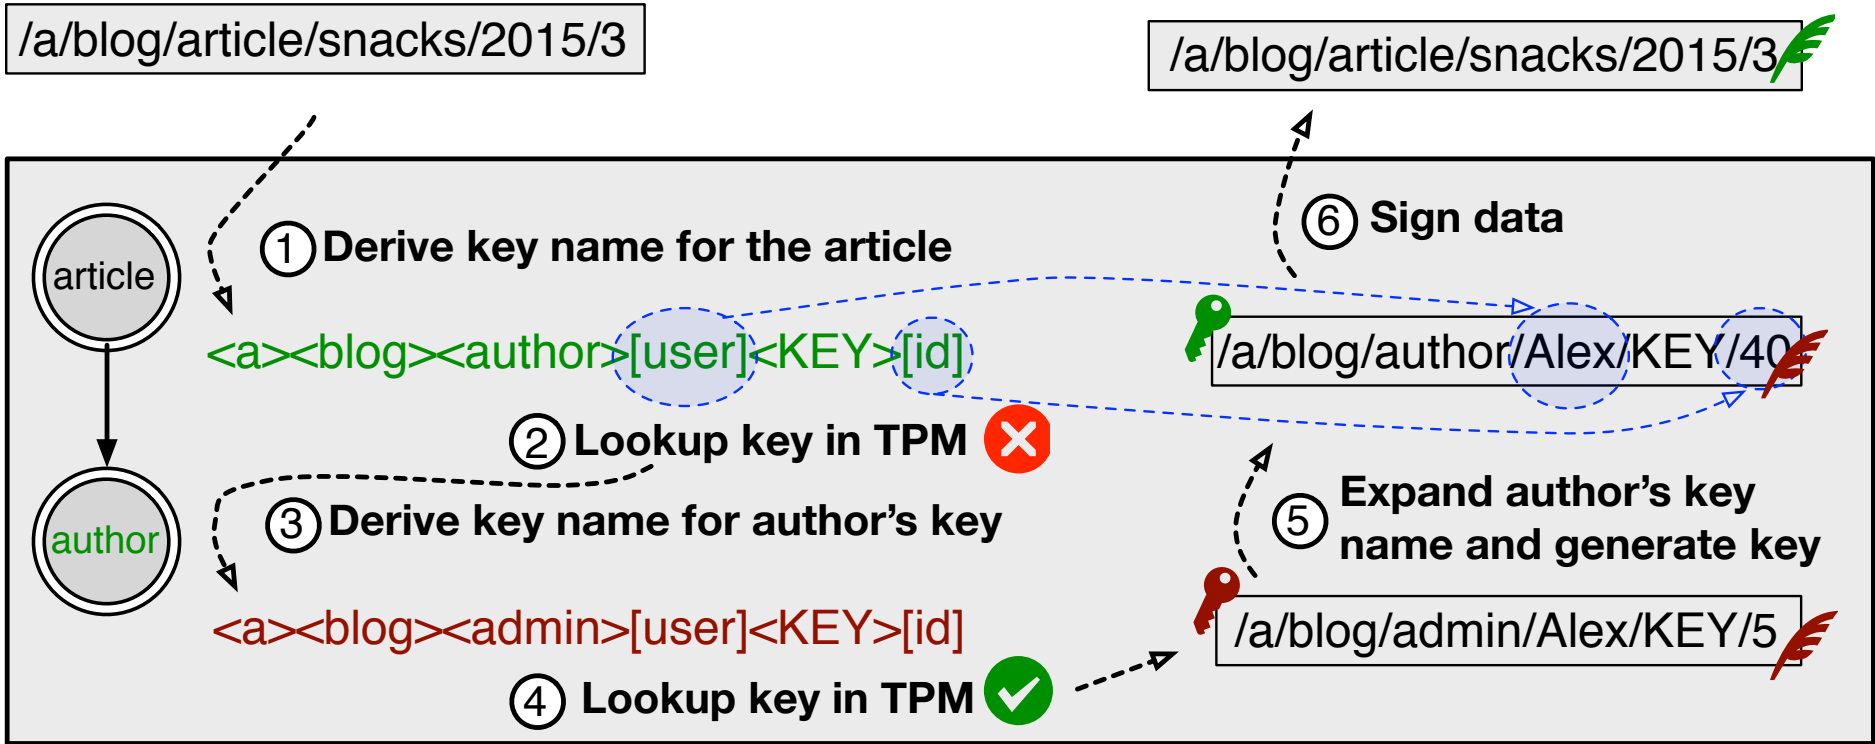

Authentication

Signing

# Automated Signing

# Trust schema is more than that ...

- Universal tool for trust management
- Representable in a data packet
  - can be retrieved and executed by **any** NDN entity
    - end application, dedicated storage, routers, ...
  - can be (recursively) authenticated using higher-level schemas
- Security design pattern
  - regulate the behavior of applications
  - a set of common trust models
  - application developer can simply select a pre-defined trust model

# Implementation

- Available in all the NDN platform libraries
  - ndn-cxx: <http://www.github.com/named-data/ndn-cxx>
    - old schema (ValidatorConf)
    - new schema implementation in the upcoming release
  - NDN-CCL: <http://named-data.net/codebase/platform/ndn-ccl/>
    - NDN-CPP, NDN-JS, PyNDN, jNDN
- Powers data and interest authentication in:
  - NFD: NDN Forwarding
  - NLSR: NDN Link State Routing Protocol
  - NDNS: NDN Domain Name System
  - Repo-ng: NDN Data Repository
  - ChronoChat: server-less multi-party chat application over NDN

# Conclusion

- Usability is critical to all security solutions
- A useful step forward in automating NDN data signing/authentication
  - explicitly defines trust relations between namespaces
  - identify common security patterns to generalize solutions
- Trust schema can be authenticated and fetched as any other NDN data packets
- Potentially applicable to other configuration/automation challenges
