

# Finally, a Use for Componentized Transport Protocols

Tyson Condie, Joseph M. Hellerstein,  
Petros Maniatis, Sean Rhea, Timothy Roscoe  
U.C. Berkeley and Intel Research Berkeley

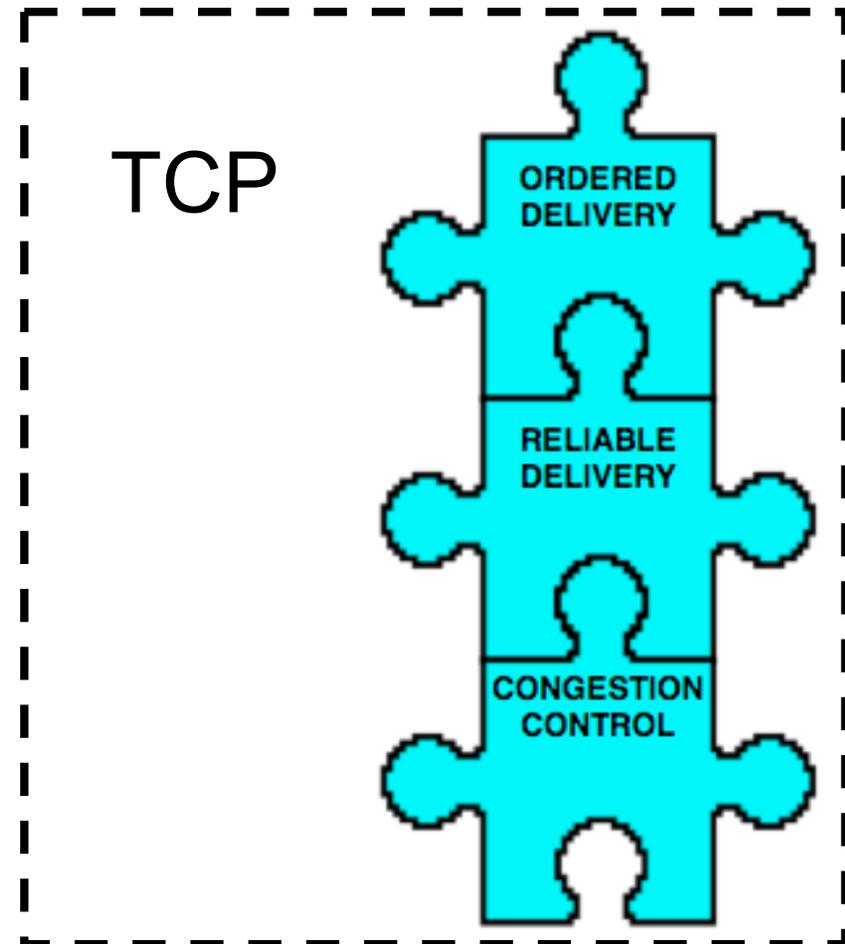

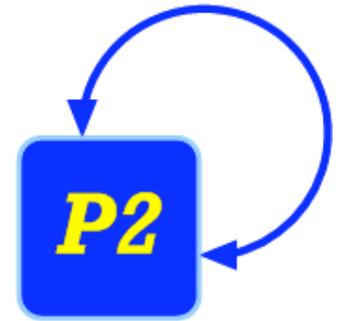

# Roadmap

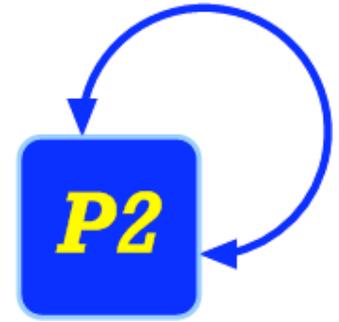

- History
- What's different now?
- New uses for componentized transport protocols
- Conclusion
- Ongoing work

# Componentized Protocols?

Decomposing transport protocols into a set of reusable building blocks that can be recomposed in different ways depending on application and network properties

# A Brief History of Componentized Protocols

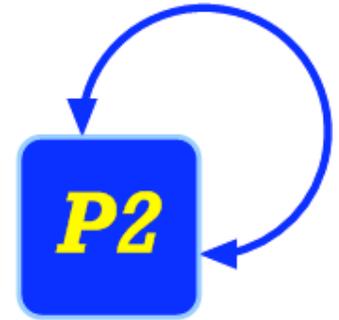

- x-Kernel system
  - Export user-level protocol objects to compose into more general communication services
- Morpheus programming language
  - Object oriented programming support for protocol objects
  - Compiler time optimizations over generated protocols
- Prolac Protocol Language
  - Expression language for developing complete protocols

~~Componentized protocols never caught on, due to the Prolac implementation for protocols in the 1990s.~~

- Most applications were satisfied with point-to-point protocols
  - TCP, RTP, SCTP, DCCP, etc.

# Why Now?

- Increasing popularity of overlay networks
  - DHT, BitTorrent, Akamai, Narada, Freenet
- Overlay networks have a broad design space
  - Nodes play the role of **client**, **server**, and **router**
- Most protocols today are tuned for point-to-point communications
  - Overlay requirements go beyond point-to-point model
  - Forces overlay programmers to develop their own handcrafted transport layer
- We have built a componentized protocol framework using a dataflow abstraction
  - Does it meet the set of opportunities and requirements of overlays?
  - Does it provide a programmer friendly framework?

*Every good work of software starts by scratching a developer's personal itch*

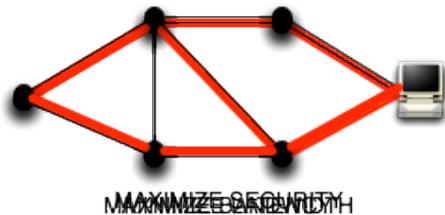

The Cathedral and the Bazaar, Raymond

# Application-level Routing Freedom

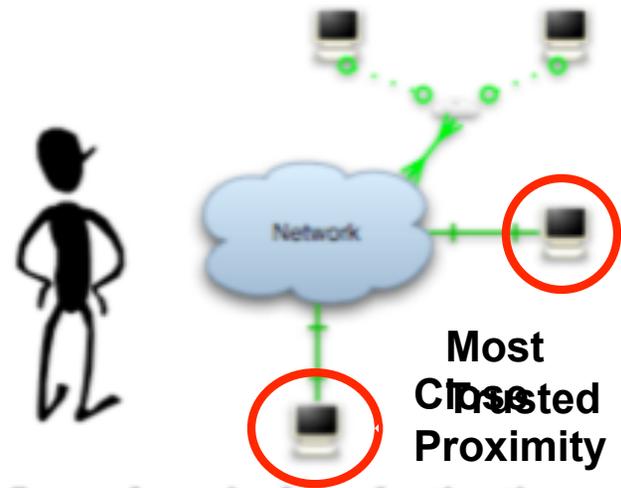

- A message need not be bound to a single destination or path
  - Several equivalent destinations
  - Several paths to get to a destination
- Fine grain application control over where a message is sent

Several paths to destination

MAXIMIZE SECURITY

Several equivalent destinations

# Alternative Congestion Control

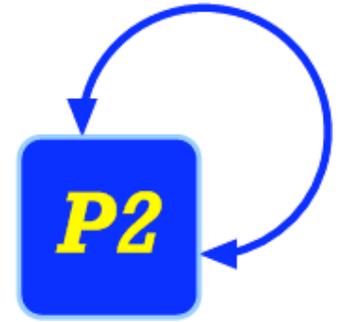

- **Per hop** congestion control
  - Recursive routing
    - UdpCC connection for each neighbor node

S. Rhea, D. Geels, T. Roscoe, and J. Kubiatowicz. **Handling Churn in a DHT.** In *Proc. of the 2004 USENIX Technical Conference*, Boston, MA, USA, 2004.

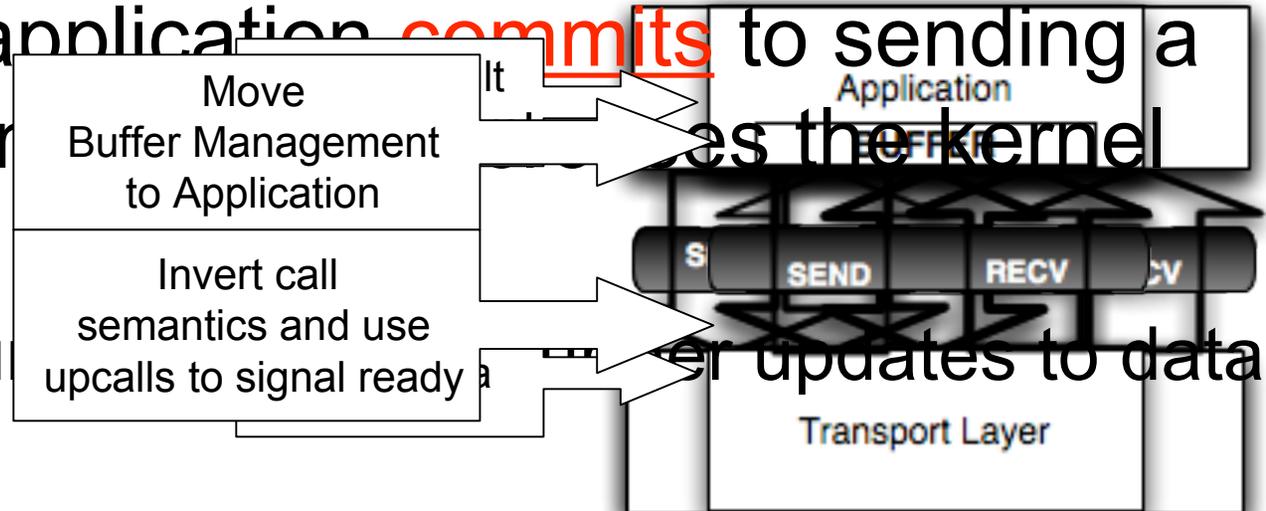

- **Aggregate** congestion control
  - Short lived connections
  - Connections that send very little traffic
  - Iterative routing (a la MIT Chord)
    - Next hop discovered during the lookup

F. Dabek, J. Li, E. Sit, F. Kaashoek, R. Morris, and C. Blake. **Designing a DHT for low latency and high throughput.** In *Proc. NSDI*, 2004.

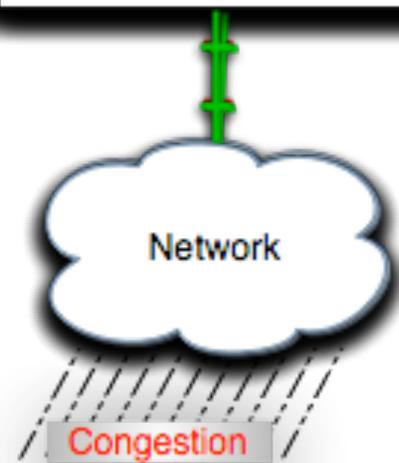

# Late Data Choice

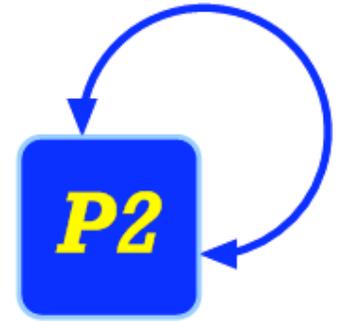

- In TCP an application **commits** to sending a packet when it crosses the kernel boundary
  - Kernel boundary

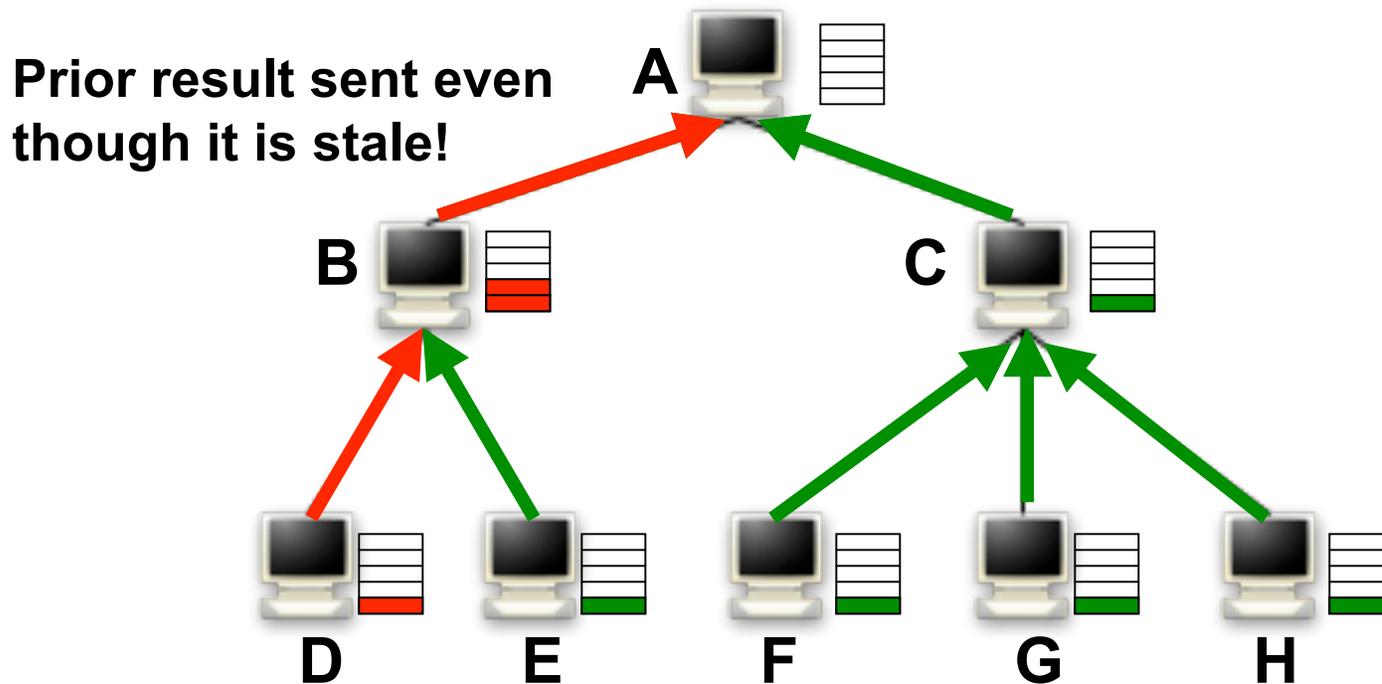

David D. Clark, "The Structuring of Systems using Upcalls, Avoiding the Operating System/Kernel Boundary", *Comm. ACM*, 38(12), Dec. 1995, pp. 1429-1435

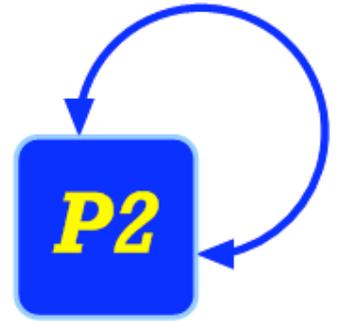

# Late Data Choice

- Application sensitive to stale results
- Transmission costs are high
  - Late data choice ensures the most up-to-date computation is sent

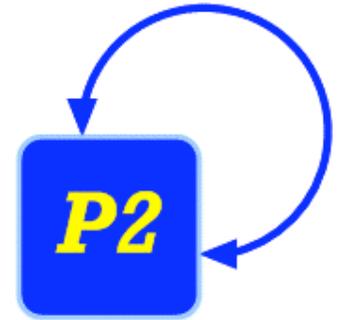

# Roadmap

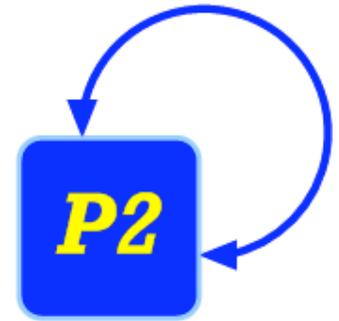

- History
- What's different now?
- New uses for componentized transport protocols
- Conclusion
- Ongoing work

# Benefits to Componentized Protocols

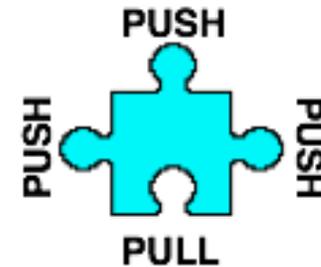

- Fine grain protocol modifications
  - Alternative congestion control
  - Message/packet level reliable delivery
  - Custom packet scheduling algorithms
- Transport layer more knowledge visible
  - Late data choice
  - Transport state can aid failure detection, replica selection, load balancing decisions, etc.
- Encode domain knowledge in the transport layer
  - Overlay routing logic
  - Message semantics

# Componentized Protocols using a Dataflow Abstraction

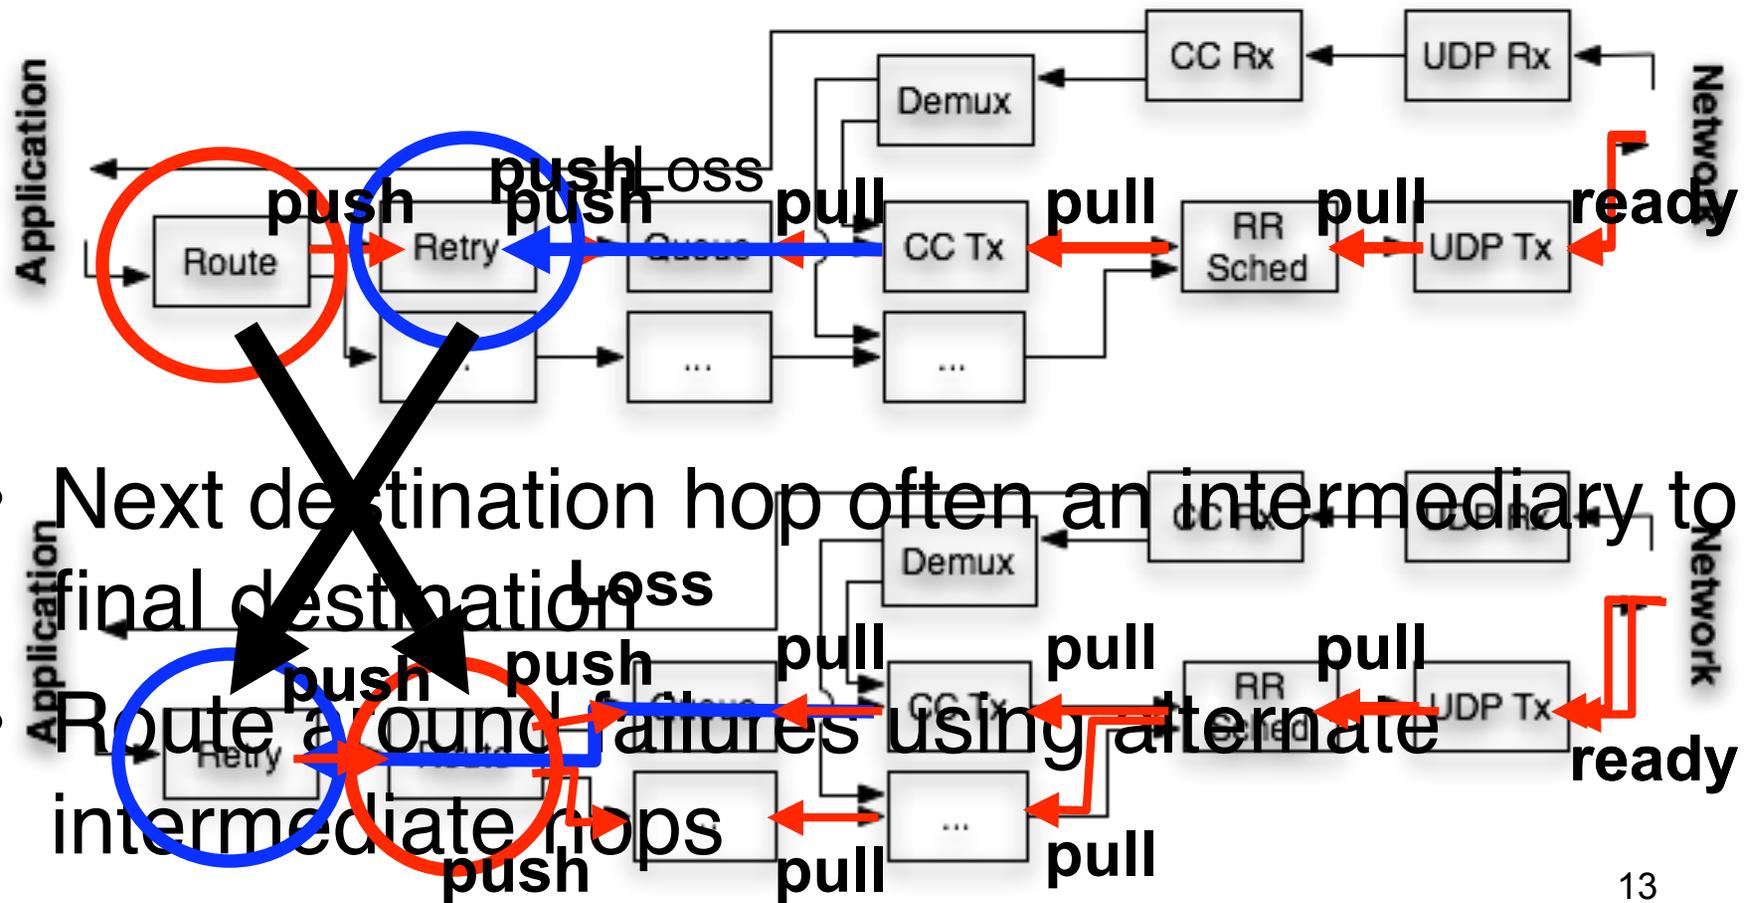

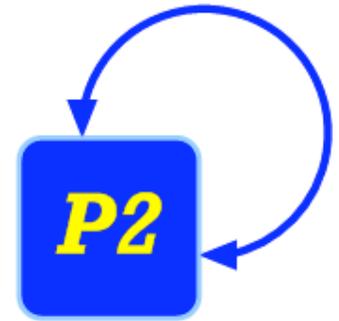

- **Graph model** places elements at the vertices
  - Elements abstract code into modular units that perform a specific task
  - Elements export **push** or **pull interface**

- **Graph structure** orders data transformations
  - Traditional protocols follow stack ordering
  - Dataflow more general
    - Protocol semantics encoded into the graph structure

E. Kohler, R. Morris, B. Chen, J. Jannotti, and M. F. Kaashoek. **The Click modular router**. ACM Trans. Comput. Syst., 18(3):263-297, 2000.

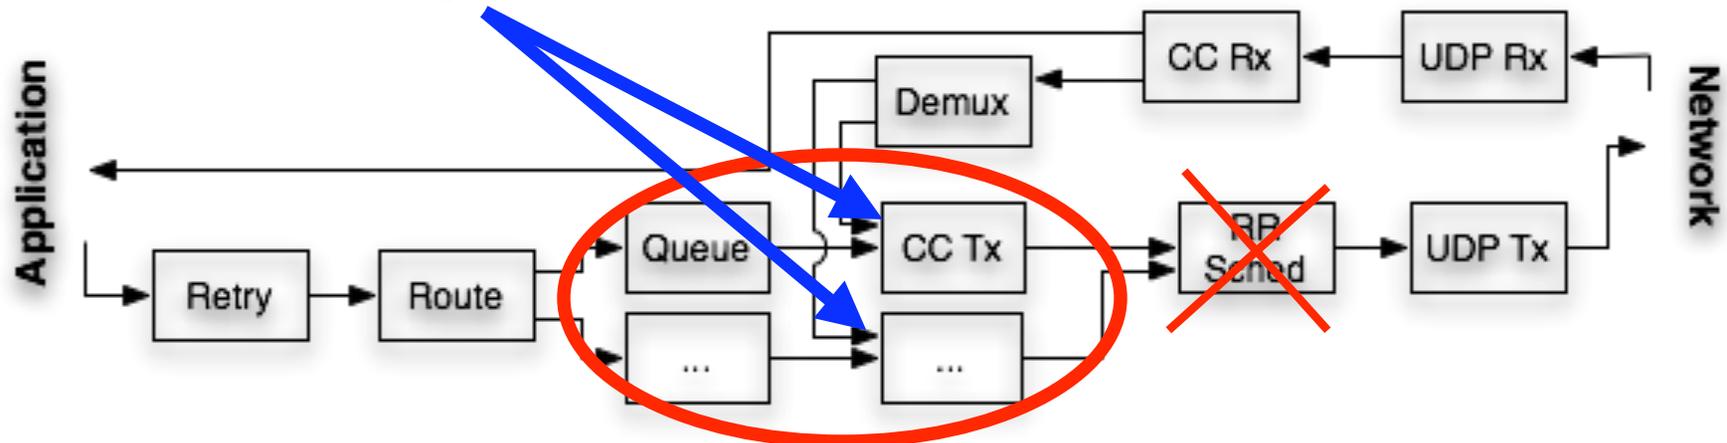

# Application-level Routing Freedom

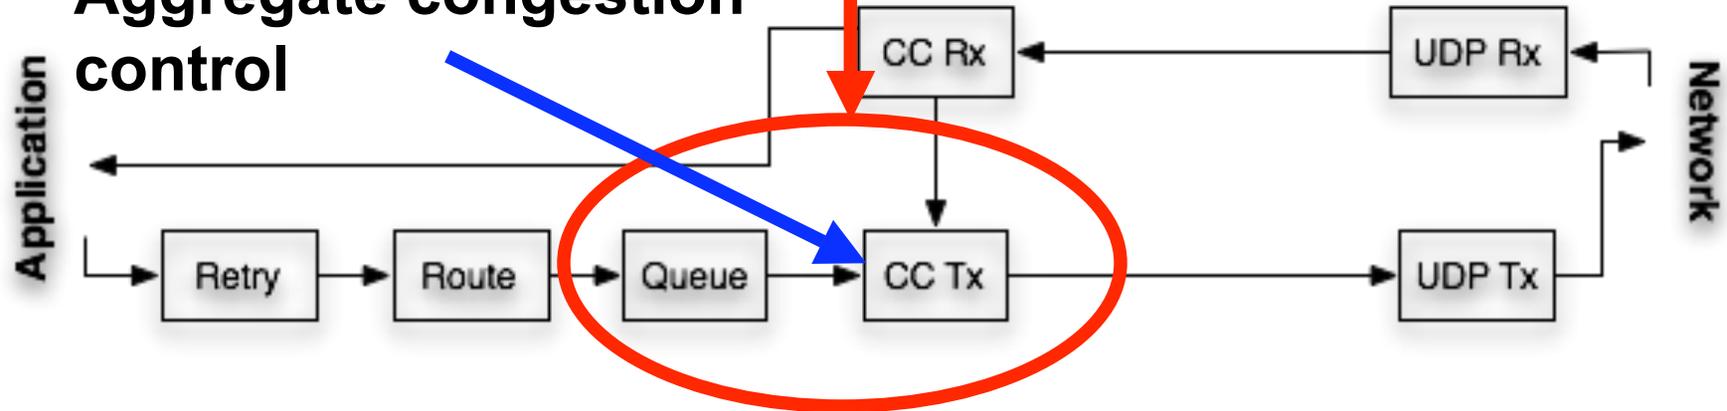

# Aggregate Congestion Control

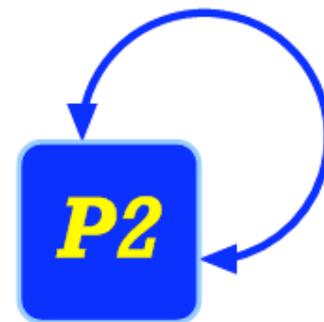

## Per hop congestion control

## Aggregate congestion control

# Late Data Choice

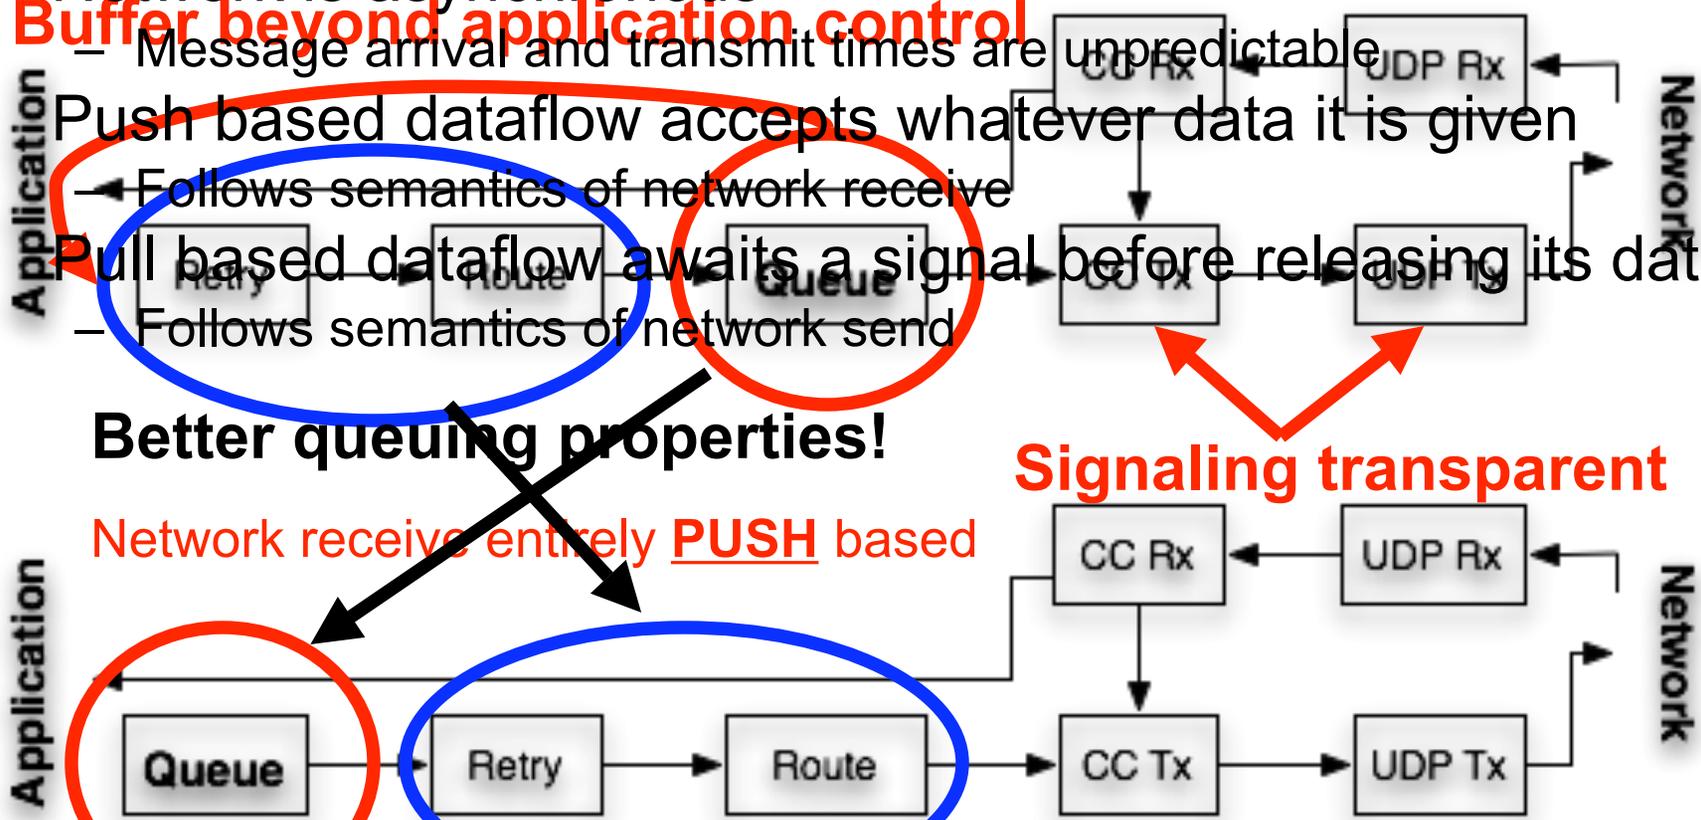

- Network is asynchronous  
 - Message arrival and transmit times are unpredictable
- **Buffer beyond application control**  
 - Push based dataflow accepts whatever data it is given  
 - Follows semantics of network receive
- **Queue**  
 - Pull based dataflow awaits a signal before releasing its data  
 - Follows semantics of network send

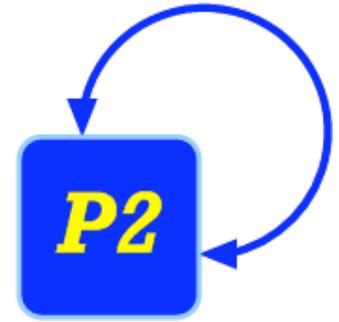

**Better queuing properties!**

Network receive entirely **PUSH** based

Network send entirely **PULL** based

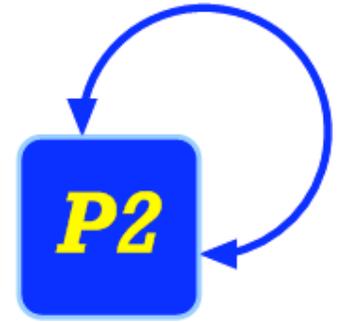

# We can do all this in P2

- P2: A query processor for constructing overlays
  - Uses a declarative language for specifying queries that describe overlay properties/invariants
  - Queries compiled into a dataflow graph
- P2 dataflow model extends into network stack
  - Satisfies our transport layer needs for building overlays
  - Blurs boundary between application and transport

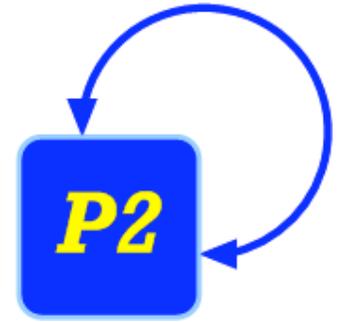

B. T. Loo, T. Condie, J. M. Hellerstein, P. Maniatis, T. Roscoe, and I. Stoica. **Implementing declarative overlays**. In *Proc. ACM SOSP 2005*.

# Conclusion

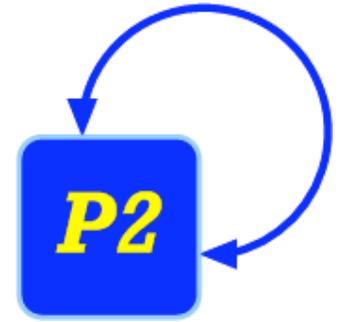

- Overlays offer many new design decisions
  - Functionality requirements go beyond the scope of current monolithic transport services
  - Requirements well suited to componentized protocols
- Componentized protocols erase the functionality boundary
  - Can encode the application and transport layer with the right set of features
- Dataflow is an instance of componentized protocols
  - Flexible glue layer between network and application
  - Code reuse through graph modification

# Ongoing Work

- Declarative language for transport layer
  - Translate high level invariants into supporting dataflow(s)
- Automatic static generation of dataflow graphs
  - Each semantically equivalent dataflow can offer certain application and network tradeoffs
  - Cost model chooses an optimal dataflow to install
- Runtime reconfiguration / reoptimization
  - What kinds of modifications and how are they triggered?
  - What kinds of statistics would aid in this effort?

# Thank You!
